SEMESTER	5th

PROJECT THEME

A Salesforce-based system for organizing student records, course information, enrollments, automation, security, reports and dashboards.

Prepared as a team project document

1. USER STORY

As a Salesforce Administrator, I want to create and manage a centralized Student Enrollment & Course Management System so that student information, course details and enrollment records can be captured, maintained and accessed efficiently. The application uses Salesforce objects, relationships, automation, security and analytics to support organized enrollment management.

2. INTRODUCTION

2.1 Project Overview

The Student Enrollment & Course Management System is a Salesforce application designed to manage student records, course details and enrollment information in one connected environment. The solution uses custom objects and relationships to maintain structured records and support day-to-day administration.

2.2 Project Purpose

The purpose of this project is to digitize enrollment records, reduce repetitive manual work, improve data organization, control access according to user responsibilities, and provide useful insights through reports and dashboards.

3. SYSTEM ARCHITECTURE

DATA RELATIONSHIP MAP

4. CORE SALESFORCE OBJECTS

Object	Role in the System
Student	Stores student identity and academic information such as name and register number.
Course	Stores course-related information and supports course selection.
Enrollment	Connects a student to a course and stores enrollment-specific information and status.

5. ENROLLMENT WORKFLOW

ENROLLMENT WORKFLOW

A simple flow from data capture → enrollment → automation → insights

6. AUTOMATION & AI-READY DESIGN

Salesforce Flow can automate selected enrollment processes such as record updates, validations and notifications. The project structure is also suitable for AI-assisted workflows, where structured student, course and enrollment data can support faster information retrieval and administrative assistance.

AUTOMATION IDEA

Student data → Course selection → Enrollment record → Flow validation/update → Report or dashboard insight

7. SECURITY SETUP

Access can be assigned according to responsibility. Administrators may receive full access, while Enrollment Officers can create and update Enrollment records and read Student and Course records. Instructors can receive read-only access to assigned enrollment information. This supports controlled access to project data.

8. REPORTS & DASHBOARDS

Reports and dashboards can summarize student counts, course-wise enrollments and enrollment status. These visual views help administrators monitor records and identify useful trends without manually checking each record.

9. PROJECT BENEFITS

- Centralized management of student, course and enrollment information.
- Clear relationship between students and selected courses.
- Reduced repetitive manual data entry.
- Role-based access for different users.
- Automation through Salesforce Flow.
- Reports and dashboards for quick analysis.
- A structured foundation for AI-assisted administration.

10. CONCLUSION

The Student Enrollment & Course Management System demonstrates how Salesforce can be used to build a structured, relationship-driven application for student and course administration. By combining custom objects, automation, security and analytics, the project provides an organized approach to managing enrollments and creates a strong foundation for future enhancements.
